

## **DAOS and ReduceMail Pro Archive – The Killer Combination**

While the native DAOS feature of Lotus Notes reduces attachment duplication and saves space, using DAOS with ReduceMail Pro Archive really delivers significant space savings. This is because DAOS is less effective in a multi-server environment, continuing to save duplicate attachments on each of the multiple servers. ReduceMail Pro Archive, used in conjunction with DAOS can enhance server performance by doing a more complete job in reducing attachment duplication. RMP Archive will stop the growth of the mail server and will also allow the consolidation of attachments to occur over multiple servers in a multi-server environment.

### **How It Works**

The DAOS component performs attachment consolidation by annexing a link reference to an attachment to an email instead of annexing the attachment itself. Because of the way the reference is programmed in in the underlying code, it generally limits the storage of attachments to one per kind per server.

ReduceMail Pro Archive adds another layer of efficiency by placing attachments from multiple servers onto a single archive server. This allows DAOS to further consolidate attachments that came from different servers resulting in even more space savings and server efficiency.

### **More Attachment Management with ReduceMail Pro Attach**

For organizations that allow full-text indexing of attachments, DAOS is less efficient than ReduceMail Pro Attach. With DAOS, once the attachments are indexed, the attachment information is reduplicated. ReduceMail Pro Attach consolidates attachments such that when the attachments are indexed, they are never reduplicated in the indices.

### **Reap Additional Benefits from Mail Archiving**

ReduceMail Pro archive offers many advantages beyond DAOS enhancement. These include:

- optimization of server performance
- reduction of storage costs
- maximization of workforce productivity and profitability
- maintenance of retrievable business records for litigation and regulatory needs
